

What are the uses of methyl Propiophenone pure 99 raw materials?

[Methylpropiofenone Pure 99 Raw](#) Material is a chemical raw material that can be used in the production of various organic compounds. It is a colorless oily liquid at room temperature.

The product is an intermediate in the industrial production of methylamines, phenylacetic acids, and other chemicals. It can also be used as a chemical intermediate for the synthesis of pharmaceuticals, dyes and pigments, pesticides and other organic compounds.

Methyl propiophenone is a synthetic chemical compound used in the manufacture of a variety of products, including pharmaceuticals and fragrances. It is also used as a solvent for cellulose acetate and nitrocellulose.

Uses: Methyl Propiophenone is used as an intermediate in the production of:

1. Propanolamines – They are the main ingredient in most decongestant remedies and are used to treat symptoms of allergies.
2. Phenoxyethanol – It is added to cosmetics, shampoos, lotions, etc., to give them an extra layer of protection against bacteria.
3. Piroxicam – It is used to reduce inflammation associated with arthritis and other inflammatory diseases like psoriasis and Crohn's disease among others.
4. Tetracycline Hydrochloride – It is an antibiotic that fights bacterial infections such as pneumonia, urinary tract infections and gonorrhoea among others.

Methylpropiofenone is a colorless or light yellow liquid with a strong camphorous odor and strong narcotic action. It is slightly soluble in water, soluble in alcohol, insoluble in ether, chloroform and benzene. Methylpropiofenone is used as a starting material for the production of other drugs such as methcathinone and methylenedioxyphenylpropiofenone (MDPPP).

MDPPP is one of the most commonly used illicit stimulants in China. It has been used to treat various psychiatric conditions including depression, anxiety disorder, acute schizophrenia and others. MDPPP can be mixed with other chemicals to make a "bath salt" drug that produces effects similar to amphetamine but without being controlled by the law.

MDPPP can also be used to make MDMA (ecstasy) tablets which are often sold as ecstasy. The drug has been linked to deaths from stroke or heart failure caused by overheating or dehydration from excessive sweating during exercise while taking it.
